

1 Sept 2026

Dear Colleagues,

Call for Data: Cancer Incidence in Five Continents – Volume XIII

It is with great pleasure that, on behalf of the [International Association of Cancer Registries \(IACR\)](#) and the [International Agency for Research on Cancer \(IARC\)](#), we invite your cancer registry to submit a dataset for possible inclusion in the forthcoming **Volume XIII of Cancer Incidence in Five Continents (CI5-XIII)**.

CI5 is a longstanding collaboration between IARC and IACR and remains a unique source of cancer incidence data from high-quality population-based cancer registries around the world. The principal objective of the series remains as an exposition of comparable cancer incidence based on high-quality data made available by population-based cancer registries worldwide. The recorded incidence data is also a primary source of the GLOBOCAN national estimates in 186 countries, currently available for the year 2024 on the [Global Cancer Observatory \(GCO\)](#).

The new Volume XIII (CI5-XIII) will include incident cancers for the period 2018-2022 and, as previously, published as an online book and abridged pdf. The sets of registry-specific and summary tables available will be similar to those published in Volume XII, based on ICD-10 cancer sites, and, for specific cancer sites, on the 4th digit categories of ICD-10 and on histological subtypes (see Chapters 3 and 4 of [Volume XII](#)).

We very much encourage all population-based cancer registries to submit their data for the specified registration period, where applicable. The attached 'Call for Data' protocol provides all the necessary specifications for providing a dataset in response to this call together with relevant explanatory notes. It can also be downloaded in [English, French or Spanish](#). Any enquiries can be sent, by e-mail, to ci5@iarc.who.int. **Please also see the "important notes" at the bottom of this letter.**

As per the data protocol, those registries included in the previous CI5 Volume (CI5-XII) are encouraged to send incidence data for more recent years where the incidence is considered reasonably complete. The data from these additional years will not be included in the formal CI5 data evaluation process – which exclusively reviews the dataset spanning 2018-22. Instead, the more recent data will be used to showcase the timely and high-quality incidence data available from cancer registries on the GCO on [Cancer Over Time](#).

In summary, the submitted data will populate the following visualisation tools on the IARC/IACR websites:

[CI5 2.0.](#)

- Based on the recorded incidence data as published in the thirteen volumes of CI5 (allowing any erratum corrections post-publication), the focus is on exploring variations in registry-specific incidence rates within and across volumes using the data as submitted by registries included in CI5.
- *CI5**. As above, but for registries included in CI5 with data spanning a minimum of 15 consecutive years that can provide more detailed data (e.g. annual data, by major histological groups) enabling comparisons across selected years and for 180+ diagnostic units. These comprise cancer sites by 3-digit level ICD-10, and for certain sites, by histological subtype. Registers will be able to opt out of providing such data if they so wish.

[GCO: Cancer Over Time](#)

- The site presents national (or nationally representative) cancer trends based on high-quality routine data. Incidence data will be used for countries with cancer registries included in CI5 and spanning a minimum of 15 consecutive years, based on either national registry data, or one or more subnational registries within the country. As stated above, registries will be able to submit more recent incidence data to ensure the website contains timely incidence data from cancer registries as well as equivalent mortality data from vital registration systems.

GCO: Cancer Today (GLOBOCAN estimates)

- The data submitted to CI5-XIII may be used indirectly to build future iterations of the biennial GLOBOCAN national estimates.

All datasets submitted to CI5-XIII will be carefully evaluated by the assigned in-house Editorial Board:

- | | |
|---------------------|--------------------------|
| • Freddie Bray | • Adalberto M. Filho |
| • Aude Bardot | • Isabelle Soerjomataram |
| • Murielle Colombet | • Ariana Znaor |
| • Les Mery | |

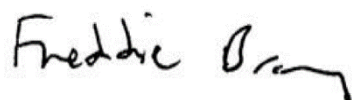

In addition, we will also invite regional experts to serve as Editors, bringing a needed local focus to the evaluation from the IACR and the [Global Initiative for Cancer Registry Development \(GICR\)](#). Collectively, the Editors will have the task to ensure the published results adhere to the strict quality criteria imposed across volumes.

As with previous CI5 volumes, eligibility to submit data, requires registries to be population-based, voting or associate members of IACR, and to collect information on patients diagnosed with all cancer sites and types in all age groups. Please contact the IACR secretariat or visit the IACR website (<https://www.the-iacr.net/>) for more information on joining the Association.

All required material described in the call for data can be submitted from this point forward until **30 November 2026**, but early responses will be greatly appreciated. For a submission to be complete, it will be necessary to provide both the dataset and the questionnaire.

The CI5-XIII Editorial Board, the IACR and IARC look forward to working with population-based cancer registries around the world on this flagship project.

With best wishes,

Dr Freddie Bray
Head, Cancer Surveillance Branch
brayf@iarc.who.int

Important notes:

1. A reminder that the closing date for this call is **30 November 2026**.
2. We will use a new Registries Portal developed in REDCap. To access the portal, you will receive an automated email containing your username and a link to set your password. Please make sure to provide/update the information and contact details for your registry when you first use the Registries Portal (<https://csu.datacollect.iarc.who.int/redcap/>) in the section 'Registry contacts'.
3. Many population-based cancer registries experienced operational disruptions during the COVID-19 pandemic, particularly affecting case ascertainment in 2020 and 2021. During the CI5-XIII review process, evidence of a specific shortfall in cases during one or both years in submitted datasets will be denoted with an asterisk.
4. We have included several items used to estimate survival (vital status and date of last contact) and stage at diagnosis (TNM stage and edition), with related questions incorporated in the questionnaire. Inclusion of these variables should be considered optional in terms of the incidence data submission; the collected data may be used in specific studies coordinated by IARC but only with the prior permission of each cancer registry submitting this data.
5. We recognise that registries may face challenges sending the requested individual-level data given present national data protection regulations. If this is an issue for your registry, please contact us as early as is possible at the above email address.
6. Please send any queries or requests for further information to ci5@iarc.who.int.
